

PRESS RELEASE

Wave International launches Wavebrite, Grey Water Filter System at METS

Stand 03.100

Wave International, manufacturer of the renowned Wavestream bilge filtration system, is to launch its latest innovation – The Wavebrite grey water filter system - at this year's METS.

Suitable for a wide range of boats, Wavebrite is a unique filter unit that processes grey water from the source to overboard. All grey water pollution such as soaps, shampoo, toothpaste, shaving cream, laundry detergents, hair, lint, body oils, dirt, grease and chemicals are effectively removed. Clean water is then discharged with no need for grey water holding tanks - making for less weight and significantly reducing engine emissions.

Through its collaboration with Whale Pumps, UK manufacturer of high quality marine pump systems and technology, Wave International has been able to develop Wavebrite using a unique filter design that incorporates several media and flow technologies.

Wavebrite features four main components consisting of a pump strainer, pump, filters and the Wavebrite module which is connected directly to the overboard skin fitting. The only power source required is for the actual pump, which automatically pumps all grey water through the filter housings and the Wavebrite multimedia module.

Wavebrite is a high quality product that meets the EU Bathing Water Directive (91/271/EEC). Therefore the water can be discharged safely overboard. Due to the exceptional cleanliness of the filtered grey water, it can be re-used after further treatment using other standard technology.
